# SMART INCENTIVES PROJECT

## Acknowledgements

Firstly, I would like to thank my college for providing us with such an opportunity to do an internship where we get an experience to work in organizations & apply all education learnt in college. There are so many people involved in helping me in this internship, I would like to express my gratitude towards each one of them. I would like to thank Mr Rama Rao for helping me to get this internship and guiding me throughout.

I would like to thank the HR Department of Gagellan Global Solutions, Hyderabad for allowing me to pursue my internship at their company.

I would like to thank my Project Mentor Mr. M Ramarao for providing the right guidance throughout the internship and helping me throughout the project in obtaining data & explained to me various aspects about the software that helped me a lot, without his help this project would not be possible.

I would like to thank my parents for allowing me to take this opportunity of working at Gagellan Global Solutions, Hyderabad and providing me with all amenities to live in Hyderabad during the tenure of this internship. They have been a constant support.

Thank you all.

## Abstract

For developing a standard procedure to calculate incentives, modelling and forecasting strategy formation, generating reports, and approving changes in the plan, we need this **SMART INCENTIVES** software. SMART is an acronym that stands for **Specific, Measurable, Attainable, Relevant and Time bound.**

Developing this software will help the sales team in financial institutes and help them organize all the functional activities in a single platform. The authorization of using the functions will be restricted according to the role and responsibilities of the users.

The project objective will majorly focus and cover on the following:

• Product Due Diligence

• Product Performance

• Project Forecast

• Product Modification

• Product Expiry

Developing this software is immensely helpful for accessing the performance of the individual users of the organization (employee), the branch as well as for the product as per the forecast and accordingly helps in taking the decisions to make any changes to the existing products and plans. Based on the performance evaluation, the users are awarded for their exceptional performance.

This software plays a role in day-to-day activities of the users by inputting details of the sales, measuring performance (weekly, monthly, quarterly, and annually). displaying messages and notifications for meetings, defining the goal, etc.

The SMART INCENTIVES software development is planned over a period of one and half year, and the scope of this project extends only till developing the Business Requirement Document, a part of Software Requirement Specification, designing of few Mock-Up Screens and understanding the React Framework and Power BI for visual analytics of our data.

## Organization Profile: Gagellan Global Solutions

Gagellan Global Solutions Pvt Ltd. is established to provide IT services and Business consulting in Capital market, Risk Management, Treasury Management specialized in Risk and Trade Analytics platforms and OTC applications in the Asia Pacific, Europe, and Middle East Markets. Gagellan Global Solutions aims to establish itself as a Transactional Technology provider with focus on Enterprise, Integrated Mobility, Communication Solutions and Strategic Outsourcing Services.

Gagellan's IT Solutions lead to business process improvement, greater operational efficiencies in complex evolving enterprise and Risk Management Technologies, allowing greater profitability.

Gagellan has successfully provided integrated solutions in Banking and Financial Services, Market Data & Trade Analytics, Manufacturing, Supply Chain, Logistics, E Commerce and Digital Marketing.

Gagellan Vision is to be a world standard integrated Enterprise technology provider with partnership programs through innovative and cost-efficient service delivery models to their customers.

Gagellan Global Solutions draws upon the management vision that had established an IT.

Services company, servicing clients across Asia Pacific, Europe region engaging many project professionals covering various disciplines of computer science, with prime expertise on IBM, UNIX, Windows, Linux, and other platforms.

They combine products/technologies from global technology leaders with their adaptive professional services to create and rapidly deploy customized solutions for customer's unique requirements. They have developed strategic partnerships with global industry-leading organizations like:

1. Microsoft

2. Altova

Their corporate goal is to strive to achieve a consolidated, sustained, and independent growth on an international basis that ensures long-term business success.

# Introduction

SMART incentive software is going to be developed by Service Oriented Architecture (SOAl using cloud computing methodology. Microsoft Azure would be used as a cloud platform. Azure is used to ensure Software as a service (SaaS). It also ensures that the software application can be accessed globally within the financial Institution's networks and supports five types of devices. It is going to be developed using Node Framework, Workflow engine, Workflows and SQL server database.

## Project Scope & Objective

The Project scope covers new product introductions and reviews existing products performance for Financial Institutions, within their respective market space. The scope allows changes to the existing products including modification or functional extension to other products or by closing the products from the market based on forecasted performance.

The scope covers the following high-level requirements:

- The system's ability to interface with customer, market, regulations with downstream systems like HR, MIS, sales.
- Ability to interface and incorporate automated routing and notifications.

The project objective is to ensure that the following are achieved:

- Product Due Diligence
- Product Performance
- Project Forecast
- Product Modification
- Product Expiry

## MoSCoW Ranking

All requirements are important, but they are prioritized to deliver the greatest and most immediate business benefits early.

The requirements are categorized as:

**Must have** - These are critical requirements to the current delivery timebox for it to be a success. If even one Must have requirement is not included, the project delivery should be considered a failure.

**Should have** - These requirements are not necessary for delivery in the current delivery timebox. While should have requirements can be as important as Must have, they are often not as time-critical or there may be another way to satisfy the requirement.

**Could have** -These requirements are desirable but not necessary and could improve user experience or customer satisfaction for little development cost.

**Will not have (this time)** - Requirements labelled as 'Won't have been agreed by stakeholders as the least-critical or not appropriate at that time. Will not have requirements that are not planned into the schedule for the next delivery timebox.

# Business Requirements Document

## Document Purpose

This document provides the business requirements for the SMART Incentives product, its modules, sub-modules, and their workflow along with interdependencies and their desired functionality with the details about who (actor) accesses these functionalities and the input and output of each one of them.

## Project Vision and Scope

The Project scope covers new product introductions and reviews existing products performance for Financial Institutions, within their respective market space. The scope allows changes to the existing products including modification or functional extension to other products or by closing the products from the market based on forecasted performance.

The SMART INCENTIVES software helps to focus and cover following characteristics:

1) Product Due Diligence

2) Product Performance

3) Project Forecast

4) Product Modification

5) Product Expiry

The main motto of this software is to calculate the incentives for the forecasted Sires as well as maintaining the reports.

## Project Background

SMART INCENTIVES application facilitates strategy formulation, performance reporting and analysis for Existing and New product introduction (NPI) in Financial Institutions. This Software can be customized to ensure products follow the central bank regulators of each country.

SMART INCENTIVES provides a platform for financial institutional product sales forecasting and performance-based incentive calculation at the level of individual sales associate, Teller, manager, Branch, Cost centre, regions, and product category.

The business requirements and workflow solution help work with the next-generation platforms such as cloud-based, mobile-based, and web-based platforms (devices like desktops, laptops, Cloud, mobile, iPad), so that the system manages market-based product performance and forecasting analysis more efficiently.

**Table 1: Assumptions**

| NO. | Assumptions | Impact if not true |
|---|---|---|
| AS1 | All the financial institution's sales heads and sales users are inputting all the information | False data analysis |
| AS2 | If end date is not entered, keep end date value NULL | |
| AS3 | HR updates employee database regularly | Input will be missing. |

**Table 2: Dependency**

| NO | Dependency |
|---|---|
| DP1 | Central \| regulatory body |

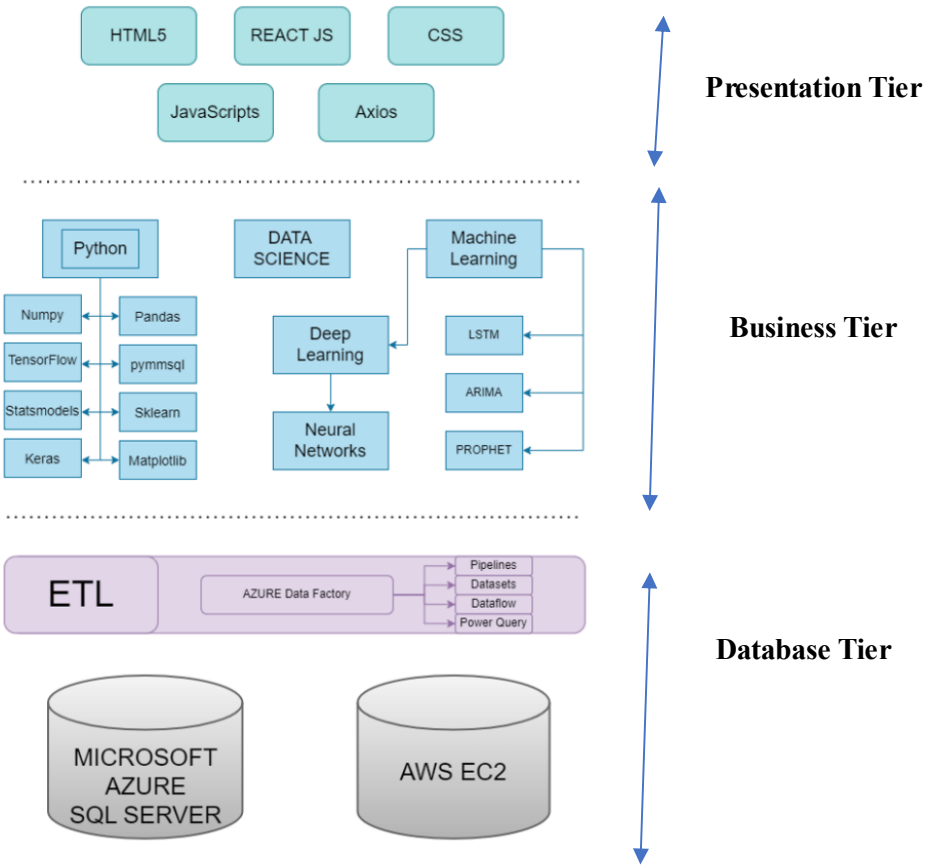
**Table 3: Constraints**

| NO | Constraint |
|---|---|
| CS1 | Upstream integration |
| CS2 | Downstream integration |
| CS3 | Master Data Update |

**Table 4: Actor Carta log**

| NO | Actor name | Description |
|---|---|---|
| A1 | User employee | Sales employee in the financial institution person |
| A2 | Employee database | Database |
| A3 | Branch database | Database of all the branch with branch id and name |
| A4 | User Sales head | Head of sales department - person |
| A5 | User Branch head | Head of the institute branch - person |
| A6 | Teller User | person |
| A7 | Loan Officer | Approval of loan - person |
| A8 | Online account manager | Online transaction manager - person |

**Architecture**



**Presentation Tier:**

**HTML5:**

HTML (HyperText Markup Language) is the most basic building block of the Web. It defines the meaning and structure of web content. “Hypertext” refers to links that connect web pages to one another, either within a single website or between websites. Links are a fundamental aspect of the Web. By uploading content to the Internet and linking it to pages created by other people, you become an active participant in the World Wide Web. HTML uses "markup" to annotate text, images, and other content for display in a Web browser. HTML markup includes special "elements" such as <head>, <title>, <body>, <header>, <footer>, <article>, <section>, <p>, , , <img>, <aside>, <audio>, <canvas>, <datalist>, <details>, <embed>, <nav>, <output>, <progress>, <video>, <ul>, <ol>, <li> and many others.

An HTML element is set off from other text in a document by "tags", which consist of the element name surrounded by "<" and ">". The name of an element inside a tag is case insensitive. That is, it can be written in uppercase, lowercase, or a mixture. For example, the <title> tag can be written as <Title>, <TITLE>, or in any other way.

**CSS:**

Cascading Style Sheets (CSS) is a simple design language intended to simplify the process of making web pages presentable. CSS handles the look and feel part of a web page. Using CSS, you can control the colour of the text, the style of fonts, the spacing between paragraphs, how

columns are sized and laid out, what background images or colours are used, layout designs, variations in display for different devices and screen sizes as well as a variety of other effects. CSS is easy to learn and understand but it provides powerful control over the presentation of an HTML document. Most commonly, CSS is combined with the markup languages HTML or XHTML.

**JavaScript:**

JavaScript is a text-based programming language used both on the client-side and server-side that allows you to make web pages interactive. Where HTML and CSS are languages that give structure and style to web pages, JavaScript gives web pages interactive elements that engage a user. It allows users to interact with web pages, like showing or hiding more information with the click of a button, changing the colour of a button when the mouse hovers over it, sliding through a carousel of images on the homepage, zooming in or zooming out on an image, displaying a timer or count-down on a website, playing audio and video in a web page, displaying animations and using a drop-down menu.

**React JS:**

React.js is a JavaScript framework that is free to use and was created by Facebook with the goal of making it easier to create user interfaces (UIs) and UI components. By providing a component-based design, which made it simpler to create intricate and reusable UI elements, it changed web development. React uses a virtual DOM to improve rendering efficiency, reducing the need for direct DOM manipulation. Developers may specify the intended UI state using this declarative technique and React will efficiently update the real DOM to fit that description. UI components are defined using JSX, a JavaScript extension that combines HTML-like syntax with JavaScript logic. A systematic and predictable method of managing UI state and behaviour is provided by React's unidirectional data flow and component lifecycle.

**Axios:**

Axios is a versatile JavaScript library that serves as a go-to tool for handling HTTP requests in web applications. Its promise-based architecture simplifies asynchronous operations, making it particularly well-suited for dealing with data from servers or APIs. Whether you're building a client-side web application in a browser or a server-side application using Node.js, Axios provides a uniform and intuitive way to make HTTP requests. It supports various HTTP methods, including GET, POST, PUT, and DELETE, making it adaptable to a wide range of use cases. Axios automatically parses JSON responses, reducing the complexity of working with data from APIs, and its support for request and response transformation allows for easy data manipulation and formatting.

Moreover, Axios offers advanced features like interceptors, which enable you to globally intercept and modify requests and responses. This feature is invaluable for tasks such as adding authentication headers or logging network activity. Additionally, Axios provides cancellation support, allowing you to terminate ongoing requests, which is crucial for responsive user interfaces. Its browser compatibility features handle CORS-related issues seamlessly. Whether you're a front-end or back-end developer, Axios has become an essential tool in the JavaScript ecosystem, simplifying the process of integrating external data into your applications and enabling smoother communication with servers and APIs.

**Business Tier:**

**Python:** Python's simplicity of learning, adaptability, and extensive ecosystem of specialized libraries make it an essential component of data analytics. It is easy to read and understand, making it suitable for both novice and seasoned programmers. Important libraries like Seaborn and Matplotlib offer powerful visualization features, and NumPy and Pandas enable effective data processing. Machine learning activities are enabled by Scikit-learn, TensorFlow, and Keras, while statistical analysis is supported by Statsmodels. Python is the language of choice for data analysts because of its vibrant community, which guarantees ongoing development and support. This allows data analysts to easily complete tasks like statistical analysis and data cleansing, as well as complex machine learning applications.

*Numpy*: NumPy is a fundamental library for numerical computing in Python. It provides support for large, multi-dimensional arrays and matrices, along with mathematical functions to operate on these arrays. NumPy is a cornerstone for many other libraries in the data analytics ecosystem.

*Pandas*: Pandas is a powerful library for data manipulation and analysis. It provides data structures like Data Frame, which is highly efficient for working with structured data. Pandas simplifies tasks such as data cleaning, transformation, and analysis, making it a go-to library for data analysts.

*TensorFlow*: TensorFlow is an open-source machine learning framework developed by Google. It is widely used for building and training deep learning models. TensorFlow provides tools for both beginners and experts in machine learning and is extensively used in tasks like image recognition, natural language processing, and more.

*pymssql*: It seems like there might be a typo, and you may be referring to pymssql, which is a Python library for connecting to Microsoft SQL Server databases. It provides a Pythonic interface for interacting with SQL Server databases and is used for tasks such as querying and updating database tables.

*statsmodels*: Statsmodels is a library for estimating and testing statistical models. It includes tools for performing hypothesis tests, statistical models' estimation, and statistical data exploration. Statsmodels is often used for tasks related to traditional statistical analysis.

*scikit-learn (sklearn)*: Scikit-learn is a machine learning library that provides simple and efficient tools for data analysis and modelling. It includes a wide range of machine learning algorithms for classification, regression, clustering, and more. Scikit-learn is designed to be user-friendly and integrates well with other libraries like NumPy and Pandas.

*Keras*: Keras is a high-level neural networks API written in Python. It serves as an interface for building and training deep learning models using backends like TensorFlow, Theano, or Microsoft Cognitive Toolkit. Keras is known for its simplicity and ease of use, making it accessible for beginners while remaining powerful for experts.

*Matplotlib*: Matplotlib is a plotting library for creating static, interactive, and animated visualizations in Python. It provides a wide variety of charts and graphs for visualizing data,

making it an essential tool for data analysts and scientists to communicate their findings effectively.

**Data Science:** The diverse discipline of data science includes a range of methods and strategies for deriving information and insights from data. Large-scale data gathering, processing, and analysis are the fundamental components of data science, which aims to identify patterns, trends, and correlations. Predictive modelling, which uses statistical and machine learning algorithms to provide well-informed predictions or classifications based on previous data, is a key component of data science. To clean, preprocess, and analyse data, data scientists use specialized libraries and tools in addition to computer languages like Python or R. Furthermore, data science frequently entails properly understanding and informing stakeholders of the findings, bridging the gap between technical research and useful insights.

Data analytics is an essential subfield of data science that is concerned with analyzing and drawing conclusions from data. Applying statistical and computational methods to dataset exploration and interpretation with the goal of finding answers to particular queries or resolving business problems is known as data analytics. It covers a range of methods, such as diagnostic analytics (finding patterns and trends in data), prescriptive analytics (making recommendations based on insights), predictive analytics (forecasting), and descriptive analytics (summarizing and visualizing data). To put it simply, data analytics is essential to turning unprocessed data into useful information that businesses and organizations can use to improve decision-making and propel strategic goals.

**Deep Learning:** Deep learning is a subfield of machine learning that focuses on the development and training of artificial neural networks to perform tasks without explicit programming. It involves the utilization of deep neural networks, which are composed of multiple layers (deep architectures), allowing the model to automatically learn hierarchical representations of data. Deep learning algorithms, particularly deep neural networks, have demonstrated remarkable success in tasks such as image and speech recognition, natural language processing, and complex decision-making.

*Neural Networks:* Neural networks are a fundamental component of deep learning models, inspired by the structure and functioning of the human brain. They consist of interconnected nodes organized into layers, including an input layer, one or more hidden layers, and an output layer. Each connection between nodes has an associated weight, and the network learns by adjusting these weights during the training process. Neural networks are capable of learning complex patterns and representations, making them adept at tasks involving non-linear relationships and large datasets. The activation of nodes, determined by weighted inputs and biases, allows neural networks to model intricate mappings and capture intricate features within the input data, enabling them to excel in a wide range of applications.

**Machine Learning:** Machine learning in the context of time series analysis involves leveraging algorithms to discern patterns, make predictions, and extract insights from temporal data. These algorithms, ranging from traditional time series models like ARIMA to more advanced machine learning models such as Random Forests or recurrent neural networks, play a crucial role in forecasting future values, identifying anomalies or outliers, and recognizing patterns within the time series. Feature engineering is paramount in this process, aiding in the creation of relevant features to enhance model performance. Whether for predicting stock prices, energy consumption, or seasonal trends, machine learning equips analysts with tools to

handle the unique challenges posed by time-dependent data, enabling accurate forecasting and informed decision-making.

*ARIMA (AutoRegressive Integrated Moving Average):* ARIMA is a traditional time series forecasting model that combines autoregressive (AR) and moving average (MA) components. The AR component models the relationship between the current observation and its past values, while the MA component captures the relationship between the current observation and a stochastic term representing the noise. The integration (I) component refers to differencing the time series to make it stationary. ARIMA is effective for capturing linear trends and patterns in stationary time series data. Its efficiency depends on correctly identifying the order of the autoregressive, integrated, and moving average components, which can be determined through statistical methods.

*LSTM (Long Short-Term Memory):* LSTM is a type of recurrent neural network (RNN) designed to capture long-term dependencies in sequential data. It consists of memory cells with gating mechanisms that control the flow of information. LSTMs are well-suited for time series forecasting tasks where complex patterns, nonlinear relationships, and long-term dependencies exist. They automatically learn and adapt to the underlying structure of the data. LSTMs excel at capturing intricate temporal dependencies, making them more efficient than traditional models for tasks with complex dynamics, such as natural language processing, speech recognition, and financial time series prediction.

*Prophet:* Prophet is a forecasting model developed by Facebook that is specifically designed for time series data with seasonality and holidays. It decomposes the time series into trend, seasonality, and holiday components, modelling each separately. Prophet is user-friendly, requiring minimal parameter tuning, and is robust to missing data. It is particularly efficient for datasets with strong seasonal patterns and irregularities. While it may not handle complex nonlinear relationships as well as machine learning models like LSTMs, Prophet is highly efficient in scenarios where interpretability, ease of use, and the ability to handle special events or holidays are critical.

**Database Tier:**

**ETL Operations:** In Azure Data Factory, ETL operations play a central role in orchestrating data workflows efficiently. Leveraging Azure Data Factory's comprehensive ETL capabilities, users can seamlessly extract data from diverse sources, transform it through mapping, cleansing, and enrichment processes using Azure Data Flow or Mapping Data Flow, and then load the transformed data into target destinations such as Azure SQL Database, Azure Synapse Analytics, or other data storage solutions. With native integration to Azure services and a visual interface for designing and managing ETL pipelines, Azure Data Factory simplifies the development, deployment, and monitoring of ETL workflows. Additionally, features like data partitioning, data flow monitoring, and integration with Azure Monitor contribute to effective ETL operations, ensuring the reliability and scalability of data processing in cloud environments.

*Pipelines:* Pipelines are a sequence of data-driven activities. They define the workflow and orchestrate the execution of various ETL tasks, ensuring that data is moved and transformed as per the defined schedule and dependencies.

*Datasets:* Datasets represent the structure of the data that is ingested or processed in the data pipeline. They define the schema and location of the data. Datasets are crucial for ETL as they specify the source and destination of the data. They provide the necessary metadata for extracting data from source systems and loading it into target systems.

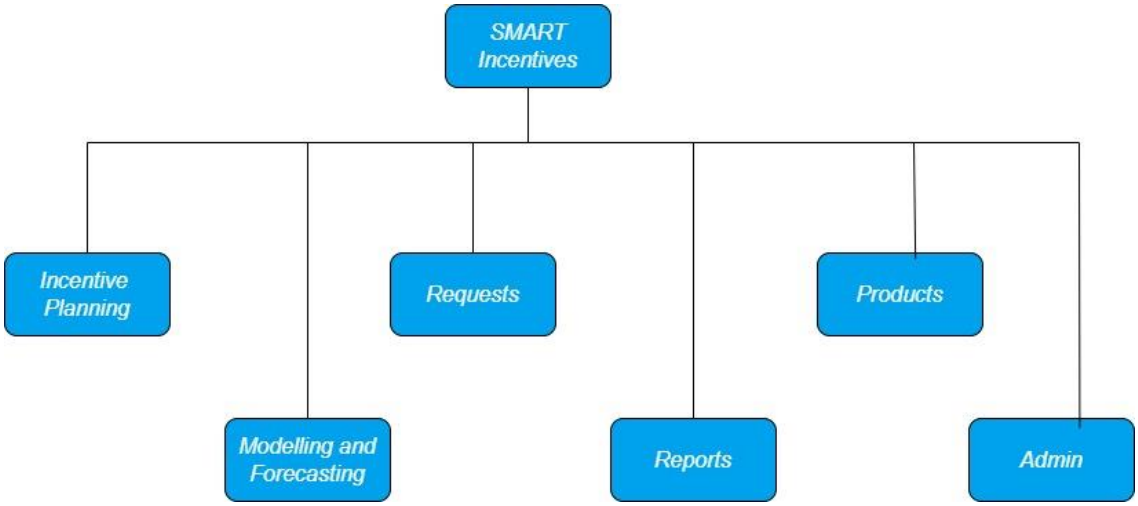
*Dataflow:* Dataflow is a transformational layer within Azure Data Factory that allows you to design and manage data transformations using a visual interface. Dataflow is where the transformation part of ETL happens. It enables you to apply various transformations to the data, such as filtering, aggregating, and joining, before loading it into the destination.

*Power Query:* Power Query is a data connection technology that enables you to discover, connect, combine, and refine data across a wide variety of sources. It is often used within Dataflow to perform data transformations. It allows users to shape and clean the data using a user-friendly interface, making it accessible to both technical and non-technical users.

**Microsoft Azure SQL Server:** Microsoft Azure SQL Server is a cloud-based relational database service provided by Microsoft Azure, designed to offer scalable and secure database solutions for diverse applications. Leveraging the infrastructure and capabilities of the Azure cloud, Azure SQL Server enables users to deploy, manage, and scale SQL databases without the need for on-premises hardware maintenance. It supports various editions of SQL Server, providing features such as automatic backups, high availability, and advanced security measures. With built-in intelligence, it offers performance optimization recommendations and robust analytics capabilities. Azure SQL Server seamlessly integrates with other Azure services, facilitating the development of modern applications through features like serverless computing, elastic pools, and intelligent caching, making it a versatile and powerful solution for organizations seeking a flexible and reliable cloud-based database platform.

**AWS EC2:** Amazon Elastic Compute Cloud (EC2) is a web service provided by Amazon Web Services (AWS) that offers resizable compute capacity in the cloud. As a central component of AWS, EC2 allows users to provision virtual servers, known as instances, with varying configurations to host applications and workloads. Users can choose from a wide range of instance types optimized for different use cases, including compute-intensive, memory-intensive, and storage-optimized workloads. EC2 provides flexibility in terms of operating systems, networking, and security configurations, enabling users to customize their virtual environments. With features such as Auto Scaling, users can automatically adjust the number of instances to handle varying workloads, ensuring optimal performance and cost efficiency. AWS EC2 plays a pivotal role in cloud computing by providing on-demand, scalable, and cost-effective compute resources for a diverse array of applications and services.

**Modules**



## 1. INCENTIVE PLANNING

- Business Requirement - Calculates the incentives.
- Description - Incentive planning can be done for different business units in a financial institute. Ex. Retail Banking, Digital Banking Mobile Banking and Telephone Banking. It deals with creating a plan and organizing a grid.

1.1 Plan Metadata

1.1.1 Award Medals

- Business Requirement-Analyse the sales performance.
- Description - Awards are awarded in three categories (Gold, Silver, Bronze) based on sales targets achieved and are configured in this section.
- MOSCOW ranking M
- Function Type - Functional

1.1.2 Driver Association

- Business Requirement - To find out the direct references to the expenses for a grid (Grid is an incentive type).
- Description-Lists down the expenses incurred.
- MOSCOW ranking S
- Function Type - Functional

1.1.3 Exceptional Payment

- Business Requirements - To find out the payments made beyond the term date.

- Description- Exceptional term payments functionality will display the list of payments beyond the term date in each business unit, for a given begin and end date.
- MOSCOW ranking S
- Function Type Functional

1.1.4 Key Driver

- Business Requirement To define the key drivers (It describes for which function type was the expense incurred Ex. Consumer origination and DDA demand deposit account) associated with a business unit.
- Description -Displays the list of the key drivers and their description for a period (begin date and end date). The key driver is assigned to a business unit. It also allows editing the description and the dates of the key drivers, along with adding new key drivers to a business unit.
- MOSCOW ranking S
- Function Type - Functional

1.1.5 Organization Goal

- Business Requirement - Assign points to an organization's business unit.
- Description - Inside an organization goal point are assigned to key drivers for each business unit. The goal points are assigned for a given period (begin date and end date). If authorized to edit the provided points to a key driver the action can also be performed and allows to delete the points assigned.
- MOSCOW ranking M
- Function Type: Functional

1.1.6 Plan Type

- Business Requirement - Define plans for a business unit.
- Description- 1. Provides a search facility for an end user to search the plan type in a business unit for a time (begin & end date) Ex. For retail banking are teller plan, teller manager plan, BSA plan, select banker plan, assistant manager plan, branch manager plan. 2. Provides a facility to add a new plan type defining the business unit, plan type name, and description of the plan with a time period (begin & end date). Plan components and roles are associated with the plan type.
- MOSCOW ranking M
- Function Type - Functional

1.2 Grid

1.2.1 Grid Creation

- Business Requirement-Creation of product grid (grid is an incentive type)
- Descriptoion-1. Creates a grid which is assigned to an organization ID and name. Ex. 6(organization ID)-Retail Banking 2. Grid name is assigned to a product with respect to beginning end date. Grid value (grid value is the number of points assigned to a grid for a product) is defined in terms of points.
- MOSCOW ranking M.
- Function Type-Functional

1.2.2 Grid Assignment

- Business Requirement-Assigning a role to the grid.
- Description-Extension to grid creation. Each grid is assigned roles e.g., Branch Manager. Grid role-value mapping is done (grid role-value mapping means that the role and the grid points are assigned to each grid) According to authorization, the roles and the grid points can be edited or deleted.
- MOSCOW ranking M.
- Function Type - Functional

1.2.3 Grid Factor

- Business Requirement-Assign points to key driver for grid range set.
- Description- Provides a search facility that displays the grid details (grid names, grid factor period) Provides an edit option for editing the grid factor values for key drivers in each grid range set (e.g., 85.0-88.99).
- MOSCOW ranking S
- Function Type - Functional

1.2.4 Grid Points

- Business Requirement-Assign points percentage wise to key drivers.
- Description-Defines the percentage for each key driver associated with a grid. According to authorization new grid point sets can also be created, and the given percentage can be edited or deleted.
- MOSCOW ranking S
- Function Type-Functional

1.3 Plan Definition

- Business Requirement - Define plans for a business unit.
- Description-The list of all the plans, along with their name, begin and end date, plan type (e.g.: - Assistant manager plan, BSA plan) for a given business unit is displayed. If authorized, the user can also create new plans and define the plan type. It contains plan rules and plan components.
- MOSCOW ranking M

- Functional Type -Functional

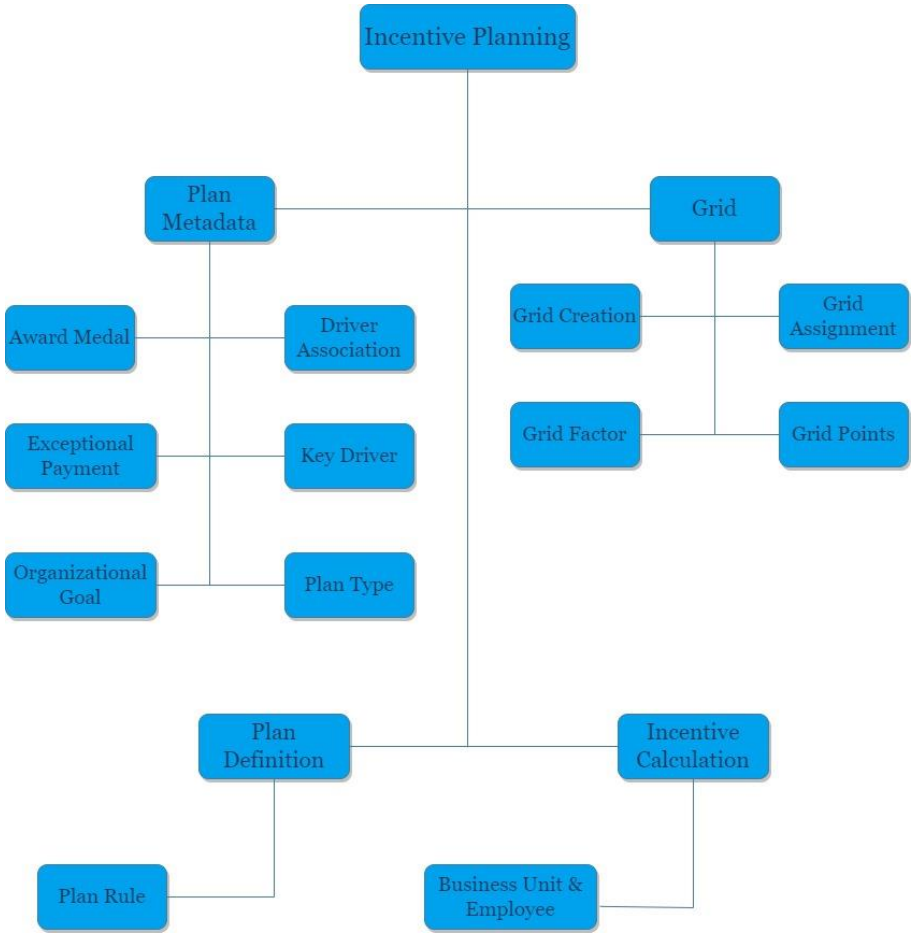
1.3. Plan Rule

- Business Requirement - Assign rules for incentive plans
- Description-Plan rule firstly defines the attributes, where it compares left and right rule parameters, based on a condition. The rule is defined for a business unit, either to an employee or a product and documents the current status of the rule, dated for a period (begin and end date). The rule created is then assigned to an incentive plan.

1.4 Incentive Calculation

1.4.1 Business Unit & Employee

- Business Requirement - Calculate incentives for the entire business unit and employees.
- Description Incentive is calculated for the entire business unit, organization type (e.g., retail banking) for a selected plan type, for a specific time period (monthly, trimester and semester), defining the period dates explicitly. The incentive is calculated for a particular user (employee) in a business unit, according to an algorithm.
- MOSCOW ranking M
- Functional Type – Functional



## 2. MODELING AND FORECASTING

### 2.1 Modelling

Modelling is done to calculate employee threshold, period wise payroll of employees, list of employees who did not receive any bonus, incentive payments for branch managers by region, product sales analysis, sales comparison, and sales analysis.

#### 2.1.1 Period Wise Payroll

- Business Requirement Calculate employee payroll periodically.
- Description-It displays the quarterly payroll analysis The table shows the date, employee name, indicator (full time/part-time), effective begin/end date, employee status, region, area, branch, tier, role, period, base threshold amount, threshold credit and total sales paid.
- MOSCOW ranking C
- Functional Type-Functional

#### 2.1.2 No Annual Bonus Analysis

- Business Requirement-Display the list of users (employees) who did not receive a
- Description-It displays the list of employees with their ten number, region and area who did not receive any annual bonus.

- MOSCOW ranking C
- Functional Type-Functional

2.1.3 Region Tier

- Business Requirement - Calculate region wise incentive payment.
- Description - It displays branch incentives globally, region wise (e.g., Region- Buffalo) and branch wise, for a specific role (e.g., branch manager) for each data (e.g., avg grid payment incentive) and overall incentive for the data is calculated.
- MOSCOW ranking C
- Functional Type-Functional

2.1.4 Product Sales Analysis

- Business Requirement- Calculate Incentive for each product.
- Description - Displays the incentive product wise. The incentives are calculated based on several types (Sales/PMI/Referral/Override) Quarterly.
- MOSCOW ranking C
- Functional Type – Functional

2.1.5 Sales Comparison

- Business Requirement - Comparing sales region wise.
- Description - Comparing the sales quantity, balance, and the payout regionally by Functional Type – Functional branch on yearly basis.
- MOSCOW ranking S

2.1.6 Sales Analysis

- Business Requirement - Calculate incentives for investment of sales branch wise/division wise.
- Description Investment of sales for each branch/division is calculated and the total of all the investments sales is made. The percentage contribution of each branch is noted.
- MOSCOW ranking M
- Functional Type - Functional

2.2 Forecasting

Forecast of the fields-employee performance comparison, employee performance by product, employee sales forecast, organization product wise sales, organization wise forecast and organization scenario wise forecast is performed.

2.2.1 Employees Performance Comparison

- Business Requirement-Forecast employee performance
- Description-It supplies employee performance comparison, for a selected product and sub-product. The comparison is of all the parameters based on years.
- MOSCOW Ranking-M
- Functional Type-Functional

2.2.2 Employee Performance Comparison by Product

- Business Requirement - Compare yearly employee sales performance by product.
- Description-The result provides comparison between years and compares increase or decrease of performance quarterly. The required parameters are types of incentive, the role of the employee, employee, the product, and the sub product.
- MOSCOW ranking M
- Functional Type - Functional

2.2.3 Employee Forecast

- Business Requirement-Forecast sales information
- Description - Employee sales forecast will analyse sales information of the employee based on parameters-types of incentive, the role of the employee, employee, the product, and sub product.
- MOSCOW ranking M
- Functional Type-Functional

2.2.4 Organization Product Wise Sales History

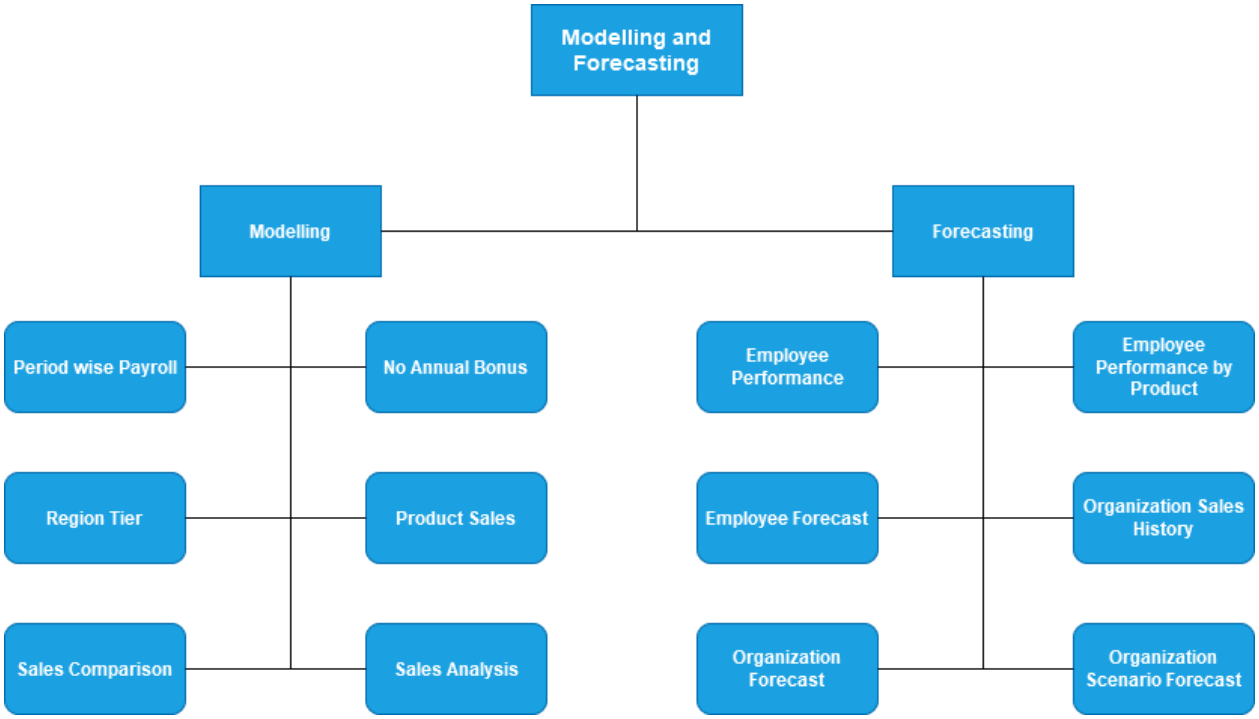
- Business Requirement - Forecast Product Sales
- Description. The sales history of the products is analysed in terms of units as well as value, required parameters-product, history period and information of organization (region, division, area, branch type, tier, and branch)
- MOSCOW ranking M
- Functional Type-Functional

2.2.5 Organization Forecast

- Business Requirement-Perform annual sales analysis quarterly.
- Description - Displays the quarterly sales analysis for each role in the branch with following attributes- number of resources, sale, incentive rate, incentive payout. The annual total of the same is made and the forecast for next year is made stating the expected employees, expected growth/reduction, expected number of sales in units, proposed incentive rate and expected incentive.
- MOSCOW ranking M.
- Functional Type-Functional

2.2.6 Organization Scenario wise forecast Sump

- Business Requirement-Forecast sales and incentive payments.
- Description For each product, the following is forecasted sales, percentage increase/decrease in sales, incentive payment, percentage increase/decrease in incentive payment. These parameters are calculated for defined scenarios. The total of incentive pay out for all the products is calculated for each scenario. It also forecasts expected no of resources, expected threshold frequency, new products added, products dropped in current period, projected incentive payout and projected increase in sales.
- MOSCOW ranking M.
- Functional Type-Functional



## 3. REQUESTS

3.1 Adjustment Request

- Business Requirement-Change request (adjustment) status.
- Description Request comes from the user to the concerned user provided with access to change the adjustment status by the admin. ## Software Requirements Specification

Requests: -

Adjustment Request and Approval

Process Flow

a) Requestor log-in to the system and raises an adjustment request.
b) The approver (user who is authorized to change the status) receives a message for request to change the adjustment status of the requester.
c) The requestor defines the adjustment type-Waiver, Retention, Sales etc.
d) Requestor also provides documents that support the request to change.
e) The approver logs-in to the system and reviews the adjustment request along the document provided by the requestor.
f) The approver takes the decision to either approve or pending or decline it.
g) If approved, the approver will change the adjustment status, and update the database.
h) If not, then define if the adjustment change request is still pending or declined, the approver then provides the reason for pending (e.g.- Incomplete documents or additional documents required) or declined (e.g.-documents not up to the mark).
i) The decision taken by the approver is updated to the requestor via messages.

Description of process: -

This process allows the requestor to capture relevant data and information in the system and send it to the approver for review, Requestor will have to key-in data as follows:

a) Specify the group where the adjustment falls.
b) Define the transaction date, branch center, product information, date of adjustment request, customer name, account number and current status.
c) Attach supporting documents for change request.
d) Submit the adjustment request.

Approver actions are as follows.

1. Evaluate the request based on the information provided by the requestor

2. Explain the reason for acceptance or pending or decline

3. Update the Adjustment Database (change status)

4. Update the status to the requestor

Admin:

user:

Description: The system should allow the admin to add a new user, delete existing user or update information of current user of the system. This will be required when a new employee has joined or when someone has left the organization or when the basic information of the employee has been changed.

**Process Flow**

1. The admin requests the server to change the user database

2. The server verifies if the admin has been authorized to amend the database.

3. If yes, the admin chooses the function it wishes to perform Add/Delete/Update)

Add- allows adding a new user to the system. Inputting the employee details like (Employee ID, name, branch, region, address, contact)

Delete this function allows deleting the user from all databases.

Update- In case of any change of employee information e.g., transfer of branch or change of address, the update needs to be made in the user database.

4. The Admin selects the function and provides the inputs required to complete the action and sends the update to the server. The server gains access to the database to reflect the changes made six. The changes are updated in the database.

5. The database sends the admin an updating confirm message to notify that the action performed has been reflected in the database.

6.The Admin informs the user, that the action has been performed

Admin will have to key-in following data:

1. Request to update database

2. Input of the function

3. Parameters related to the functions mentioned above

4. Informing user about updation

Notifications:

**Alert: -**

Description: The system allows the user to view all the alerts created for that user and read them along with creating alerts for other users. Every alert has the following categories - Alert Action (which describes what is to be done in few words), alert type (defines to which module the alert belongs to that means in which module will the alert action take place), date the date on which the alert was issue in the format dd/mm/yy) and status (where the alert has been opened or not).

Upon opening the alert - a description of the alert action is given. The alert action has been expanded.

For e.g., Key driver percentage updation - This is the alert action-upon opening the alert a brief description of alert action will be displayed on the screen - for Grid, LA the grid points are to be changed. The DDA percentage is to be increased by 25% and consumer origination is to be decreased by 25%. The brief description will give the exact details of what action is to be performed by the user who has received the alert.

**Alert: -**

Description: The system allows the user to view all the alerts created for that user and read them along with creating alerts for other users. Every alert has the following categories - Alert Action (which describes what is to be done in few words), alert type (defines to which module the alert belongs to that means in which module will the alert action take place), date the date on which the alert was issue in the format dd/mm/yy) and status (where the alert has been opened or not).

Upon opening the alert - a description of the alert action is given. The alert action has been expanded.

For e.g., Key driver percentage updation - This is the alert action-upon opening the alert a brief description of alert action will be displayed on the screen - for Grid, LA the grid points are to be changed. The DDA percentage is to be increased by 25% and consumer origination is to be decreased by 25%. The brief description will give the exact details of what action is to be performed by the user who has received the alert.

**Status-**

1.Not opened alert will have the status symbol to be an exclamation mark enclosed in a circle. Refer image for reference.

2.An Open alert will show the symbol of information i.e., enclosed in a circle, Refer image for reference.

**Messages: -**

Description: The system allows the user to view the messages addressed to that user, as well as create messages for other users to view them. Every message has the following parameters- Description (Which is the subject of the message-defines in few words what the message is

about), By (defines which user was the creator of this message), Date (the day message was sent) and Status (defines if the message has been opened or not)

Upon opening the message notification-an elaboration on the subject matter will be displayed on the screen

For e.g., Change MC's access- this is the description of the message- upon opening the message the screen will display-change the access of Mr. C from view to edit for the module sales report which is a sub module of reports.

**Status-**

1. Not an opened message will have the symbol of a closed envelope. Refer image for reference.

2. Opened message will have the symbol of an open envelope image for reference

## Conclusion

During my internship at Gagellan Global Solutions Pvt. Ltd. I got the opportunity to work on a financial institutional software named SMART INCENTIVES. I worked on the two phases of SDLC cycle-Planning and Defining. The other phases Designing, Building/ Developing, Testing and Deployment were not in the scope of this project and are aimed to be finished in another 9 months.

In this internship, learnt the importance of documenting a Business Requirement Document (BDR)and how it helps to provide a clear picture of the modules of the software. The Business Requirement Document is helpful to give an insight on all the requirements of the customer and helps in easy mapping to verify if all the requirements have been covered.

The software Requirements Specification (SRS) is a detailed description describing the functions of each module in depth along with providing the process workflow. Both BRD and SRS are helpful for designing and developing the software

The internship taught me how to implement knowledge obtained from college, and the difference between books and the corporate world.

The TIP was a simulation of a real working environment, which required us to undergo the rigor of a professional environment. In the process, it provides me with an opportunity to satisfy my inquisitiveness to know more details about the corporate world. It gave me a great exposure to my technical skills and helped me to get social skills by drawing them into communication with outside professionals for continuous interaction.
